Portfolio: savin-alex.github.io — case studies, live demos, test and audit evidence
Target role: Product Engineer (AI / LLM products)

SUMMARY

Product engineer who builds AI products alone, from the user problem to production. Since October 2025 I have built web services, a desktop app, a browser extension, and Telegram bots in Python and TypeScript. Two products run in production: a Telegram channel that publishes by itself (283 subscribers) and a photo-validation web service. I measure before I change a product, and I put cost, safety, and quality limits into the code. Before software, I spent 10 years in industrial design and engineering, 5 of them leading projects (budgets up to ₺130M, teams up to 15).

EXPERIENCE

Independent Product Engineer — own products

Oct 2025 — present | Solo: product, UX, code, tests, deployment, operations

Telegram AI News — LLM content pipeline for a live channel (t.me/ainews24by7)

May 2026 — present | Python, FastAPI, SQLite, Anthropic SDK, Ollama, APScheduler, GitHub Actions

- Built an RSS → LLM → Telegram pipeline: 56 sources every 15 minutes, separate extract, score, and write calls with structured output
- Shipped it to production: the channel publishes unattended and has 283 subscribers (September 2026)
- Made unattended publishing safe in code: only top-trust sources publish alone, max 10 posts per run, code can only make a model verdict stricter
- Controlled LLM cost: a cheap model filters and a strong model writes; every call is logged with tokens and cost; billing errors stop new runs
- 243 tests; CI with hash-locked installs and pip-audit; closed 13 security audit findings (SSRF, link injection, token leakage)

PhotoValid — photo validation and auto-fix web service for U.S. DV-lottery applicants

Oct 2025 — present | Python, FastAPI, MediaPipe, OpenCV, PostgreSQL, Docker, Coolify

- Built and deployed a web service with 32 checks, a deterministic auto-fix, and 11 UI languages; it runs in Docker on a VPS
- Audited 763 photos and 1,152 injected defects; the fix gave visible seams in 4 of 10 padded files, so I removed padding and upscaling
- Added an output gate that re-checks every fixed file before delivery; p95 latency is 184 ms per upload on one CPU core
- Built a paid flow (Robokassa, credit ledger, refunds), then moved the product to free with optional tips in September 2026

AI Consul — privacy-first desktop copilot for live meetings and interviews

Nov 2025 — present | Electron, TypeScript, React, Python, WhisperLiveKit, Ollama, OpenAI / Anthropic / Google APIs

- Built live on-device transcription and AI suggestions, with 5 speech engines and 4 LLM providers behind fallback routers
- Built an A/B harness for streaming decode: worst-case transcript lag fell from ~23 s to under 1 s, decoder stalls from 15 to 0 per session
- Found a cold-start fault in a real user session (20 s lag, hallucinated transcript) and fixed it with a locally bundled model warmup
- Turned real session logs into typed circuit breakers, a per-attempt LLM cost ledger, and latency telemetry; 638 tests

PII protection products — engine, API, web app, browser extension

Apr 2026 — present | Python, FastAPI, PostgreSQL, Redis, Presidio, spaCy, Next.js, TypeScript, Chrome Extension MV3, Docker

- Built a local RU/EN pseudonymization engine: regex with checksums, NER, LLM fallback, AES-256-GCM vault; macro F1 0.9997 on synthetic data
- Moved the engine into a reusable package with a versioned /api/v1 gateway (accepted after an independent review)
- Built RemovePII on the same engine: a Next.js web app that masks documents before users share them with AI, then restores the answer; 1,392 tests, pre-beta
- Built PII Firewall, a Chrome extension with zero network permissions that masks personal data in the browser (36 data types); 117 tests, v0.5.0 release candidate

Multi-Agent AI Development Pipeline — from a Jira issue to a GitHub pull request

Apr 2026 | Python, Claude API, Jira Cloud, GitHub API, GitHub Actions, Docker

- Built a planner / coder / reviewer agent loop with a network-isolated Docker sandbox, secret scan, human review, and API budget guard; 150 runs, 55 tests

Also built: DemoTel — deterministic Telegram support bot with 50 scenarios and no LLM (84 tests); CardsKnow — Telegram bot with Telegram Stars payments and a tested buy → unlock → refund flow; Usadba — merge game for Yandex Games.

Arkhitek AI — Project Manager (internship, under NDA)

2026

- Led delivery of a RAG system for regulatory documents: vector database, answers only from retrieved text, a source check for every statement

Industrial design and engineering — Project Manager / Lead Engineer

2015 — 2025

- Led projects with budgets up to ₹130M, teams up to 15, and 5+ contractors: schedule, budget, scope changes, and stakeholders

SKILLS

Languages: Python, TypeScript, SQL

Backend: FastAPI, Pydantic, PostgreSQL, SQLite, Redis, OpenAPI, APScheduler

Apps: React, Next.js, Electron, Chrome Extensions (Manifest V3), Telegram Bot API

AI / ML: Anthropic and OpenAI APIs, Ollama, structured output, LLM evals, Whisper, MediaPipe, OpenCV, Presidio, spaCy

Quality and operations: pytest, Vitest, Hypothesis, mypy, ruff, GitHub Actions, Docker, Coolify, Linux VPS, security audits

Product: problem framing, scope, success metrics, A/B tests, cost per run, release gates

EDUCATION

Information Systems and Technologies — higher education, 2008

Yandex Practicum — IT Project Management, 2026 (team case: mobile app for a restaurant chain, Figma prototype)

Codecademy — Computer Science: algorithms, data structures, 2025

Google IT Project Management Professional Certificate — in progress

Languages: Russian (native), English (B2)

Code: private repositories; I give a code walkthrough on request.
